An Abdominal Aortic Aneurysm (AAA) is a weakening in the wall of the abdominal section of the aorta, which is the largest artery in the body. Once a section of the aortic wall is weakened, the pressure from the blood flowing through causes the aorta to bulge or balloon, resulting in the formation of an aneurysm. A large proportion of AAAs are asymptomatic until the development of rupture. AAA rupture can be acute and is life-threatening. The most accepted definition of an AAA is based on the diameter of the artery, with a diameter of 3.0 cm or larger considered to be an aneurysm. This is more than two standard deviations (SDs) above the average diameter of the abdominal aorta (2.0 cm) in both men and women. The abdominal aorta diameter varies somewhat by age, sex, and body size, which may influence the accuracy of this definition in some subgroups. An AAA is also defined as a maximum infrarenal aortic diameter of at least 1.5 times larger than the expected infrarenal aortic diameter. This definition, however, is less...
